## AMENDMENTS TO CLAIMS

**Please amend** the claims as follows (wherein additions are shown by underlining and deletions are shown by strikethrough in amended claims):

1. (Currently amended): In a computer system configured for providing hardware events to software, a method comprising:

determining <u>from a set of possible events</u> at least one wake event directed to waking the system; <u>from a set of possible events</u>, and

selectively enabling each wake event via the software to cause a method to be run for each wake event having an associated method; and

selectively determining whether to re-enable each wake event such that the software controls whether to rerun any method associated with any wake event signaling that its associated method is to be run.

- 2. (Original): The method of claim 1 wherein determining at least one wake event includes accessing information provided in system firmware.
- 3. (Original): The method of claim 1 wherein selectively enabling each wake event includes writing at least one bit to a register location.
- 4. (Original): The method of claim 1 wherein determining at least one wake event includes determining a wake only event, and wherein selectively enabling each wake event includes not enabling the wake only event when the system is in a running state.

In re Application of PLANTE et al. Serial No. 09/552,944

5. (Original): The method of claim 1 wherein determining at least one wake

event includes determining a wake only event, and wherein selectively enabling each wake

event includes enabling the wake only event when the system is entering a sleep state.

6. (Original): The method of claim 1 wherein determining at least one wake

event includes determining a wake only event, and wherein selectively enabling each wake

event includes enabling the wake only event when a device is entering a low power state.

7. (Currently amended): The method of claim 1 wherein determining at least

one wake event includes determining a shared wake and run-time event, and wherein

selectively enabling each wake event includes enabling the shared event, and handling the

shared event as a run-time event when the system is in a running state and as a wake event

when the system had been in a sleeping state.

8. (Original): The method of claim 1 further comprising, receiving a signal

corresponding to an enabled event, and causing execution of a method in response to the

signal.

9. (Original): The method of claim 1 further comprising, receiving a signal

corresponding to an enabled event, and waking a device in response to the signal.

3

- 10. (Original): The method of claim 1 further comprising, receiving a signal corresponding to an enabled event, and waking the system in response to the signal.
  - 11. (Canceled)
  - 12. (Canceled)
  - 13. (Currently amended): A computer system, comprising:
- a status register configured to receive signals corresponding to events from hardware devices;

an enable register connected to system software and configured to enable events having signals received in the status register; and

a component of the system software configured to determine, from a set of possible events, wake events directed to waking the system, system, from a set of possible events and further configured to selectively enable each wake event to cause a method to be run for each wake event having an associated method, and to selectively determine whether to re-enable each wake event, such that the component controls whether to rerun any method associated with any wake event signaling that its associated method is to be run.

14. (Original): The system of claim 13 wherein the component accesses information provided in system firmware to determine the wake events directed to waking the system.

15. (Original): The system of claim 13 wherein the component maintains a plurality of data structures for tracking wake event information.

16. (Original): The system of claim 13 wherein the component accesses a namespace to determine a method corresponding to an event.

- 17. (Original): The system of claim 16 wherein the component accesses information provided in system firmware to construct the namespace.
- 18. (Original): The system of claim 13 wherein the component system accesses system firmware to determine events that are shared wake events and run-time events.
- 19. (Original): The system of claim 13 wherein the component system accesses system firmware to determine events that are wake only events.
- 20. (Currently amended): A computer-readable medium having stored thereon a data structure comprising:

a first set of information corresponding to a set of events that are wake only; and a second set of information maintaining events for which there exists a GPE control method; and

wherein the first, second and third sets of information are accessed to cause a method associated with a wake event to be run and to selectively determine whether to reenable the wake event after its associated method has run.

21. (Original): The computer-readable medium of claim 20 wherein the data structure further comprises a third set of information corresponding to a set of events which are currently enabled.

M

- 22. (Original): The computer-readable medium of claim 20 wherein the data structure further comprises a third set of information corresponding to a set of shared wake events and run-time events.
- 23. (Original): The computer-readable medium of claim 20 wherein the data structure further comprises a third set of information corresponding to a set of events that have started to be processed, but have not yet completed.
- 24. (New): A computer-readable medium having computer-executable instructions, which when executed perform the method of claim 1.
- 25. (New): In a computer system, a method comprising:

  receiving a wake event provided via hardware;

  running a method associated with the wake event; and

  after completion of the method, selectively determining in software whether the

  wake event requires re-enablement, and if so, re-enabling the wake event.

- 26. (New): The method of claim 25 further comprising, identifying the wake up event by accessing information provided via system firmware.
- 27. (New): The method of claim 25 wherein re-enabling the wake event includes writing to a register location.
- 28. (New): The method of claim 25 further comprising, selectively enabling the wake event, including not enabling the wake event when the system is in a running state.
- 29. (New): The method of claim 28 wherein selectively enabling the wake event includes enabling the wake only event when the system is entering a sleep state.
- 30. (New): The method of claim 28 wherein selectively enabling the wake event includes enabling the wake event when the system is entering a low power state.
- 31. (New): The method of claim 28 wherein the wake event shares a hardware register location with a run-time event, and further comprising, handling an event at that location as a run-time event when the system is in a running state and as a wake event when the system had been in a sleeping state.
- 32. (New): A computer-readable medium having computer-executable instructions, which when executed perform the method of claim 25.

In re Application of PLANTE et al. Serial No. 09/552,944

33. (New): In a computer system, a method comprising: identifying a shared event comprising a wake event shared with a run-time event;

selectively enabling the shared event;

selectively determining whether the shared event is to be re-enabled, and if so, reenabling the shared event.

34. (New): The method of claim 33 wherein identifying the shared event includes accessing information provided in system firmware.

- 35. (New): The method of claim 33 wherein selectively enabling the shared event includes writing to a software register location.
- 36. (New): The method of claim 33 further comprising handling the shared event as a run-time event when the system is in a running state and as a wake event when the system had been in a sleeping state
- 37. (New): A computer-readable medium having computer-executable instructions, which when executed perform the method of claim 33.
